B. Scaling with problem size (log-log slope = growth exponent in λ)
per training step (eval + decode)
log2 q = 30 (native), slope 1.52
log2 q = 61 (object), slope 1.79
log2 q = 127 (object), slope 1.80
seconds
λ = C(m+2, 2) workers
setup, once per upload (construct + store + build M)
log2 q = 30 (native), slope 1.54
log2 q = 61 (object), slope 2.52
log2 q = 127 (object), slope 2.52
seconds
λ = C(m+2, 2) workers
